

Lagoon Dredging Dump Site Remediation

Part of the [San Dieguito River Park's Non-Tidal Uplands Habitat and Public Access Plan](#):

To convert a disturbed area to habitat to what they believed to have occurred in the area prior to disturbance. Habitats to be restored include nontidal wetlands such as riparian scrub and freshwater marsh, coastal sage scrub, native grasslands, chaparral, and salt marsh transition. The plan also recommends removal of invasive, nonnative species from the surrounding wetland areas, restoration of historic riparian corridors, provision of habitat for threatened and endangered wildlife, and creation of habitat suitable for use by migrating birds such as Canada geese.

The San Dieguito Lagoon is the exit point for one of San Diego's 11 watersheds and is located just south of the Del Mar Fairgrounds. You can read more about its history on the [San Dieguito River Park's \(SDRP\) website](#).

Project is to assess the viability of one of the dump sites for the lagoon dredging and provide recommendations for remediation. They have only had success growing salt bush, but would like to include sage scrub and other native species (see left).
